

# Five USE CASES FOR SD-WAN

As digital businesses are moving applications to the cloud, IT is being challenged to find an easier way to connect users and devices to cloud applications.

SD-WAN from Natilik and Cisco delivers applications to users and devices across any cloud without compromising on visibility, security, or performance.

1

## SECURE, DIRECT INTERNET ACCESS (DIA)

DIA enables branch employees and guests to connect to the Internet locally, offloading traffic through the WAN while increasing security and improving Internet performance. The result is efficient and cost-effective access to the Internet with direct access from the branch.

2

## REGIONAL HUB MULTI-CLOUD ACCESS

Simplify multi-cloud adoption by consolidating cloud access and security policies into regional co-location facilities that are close to all major SaaS and public cloud providers.

3

## APPLICATION PERFORMANCE OPTIMISATION

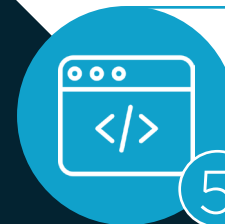

Design a global network where the critical enterprise applications always maintain the highest service level agreements (SLAs) for optimal performance, even if problems occur in the network.

4

## BRANCH MULTI-CLOUD ACCESS

Connect users to cloud applications and infrastructure seamlessly with unified visibility and management.

5

## SECURE & AUTOMATED

Migrate away from traditional, operationally complex WANs to an agile controller-based WAN with robust security features.
